

# Current clear-to-trade process

*Dynamic requirements determine what runs; non-dependent fulfilment starts early; readiness is continuously reassessed and published as structured state*

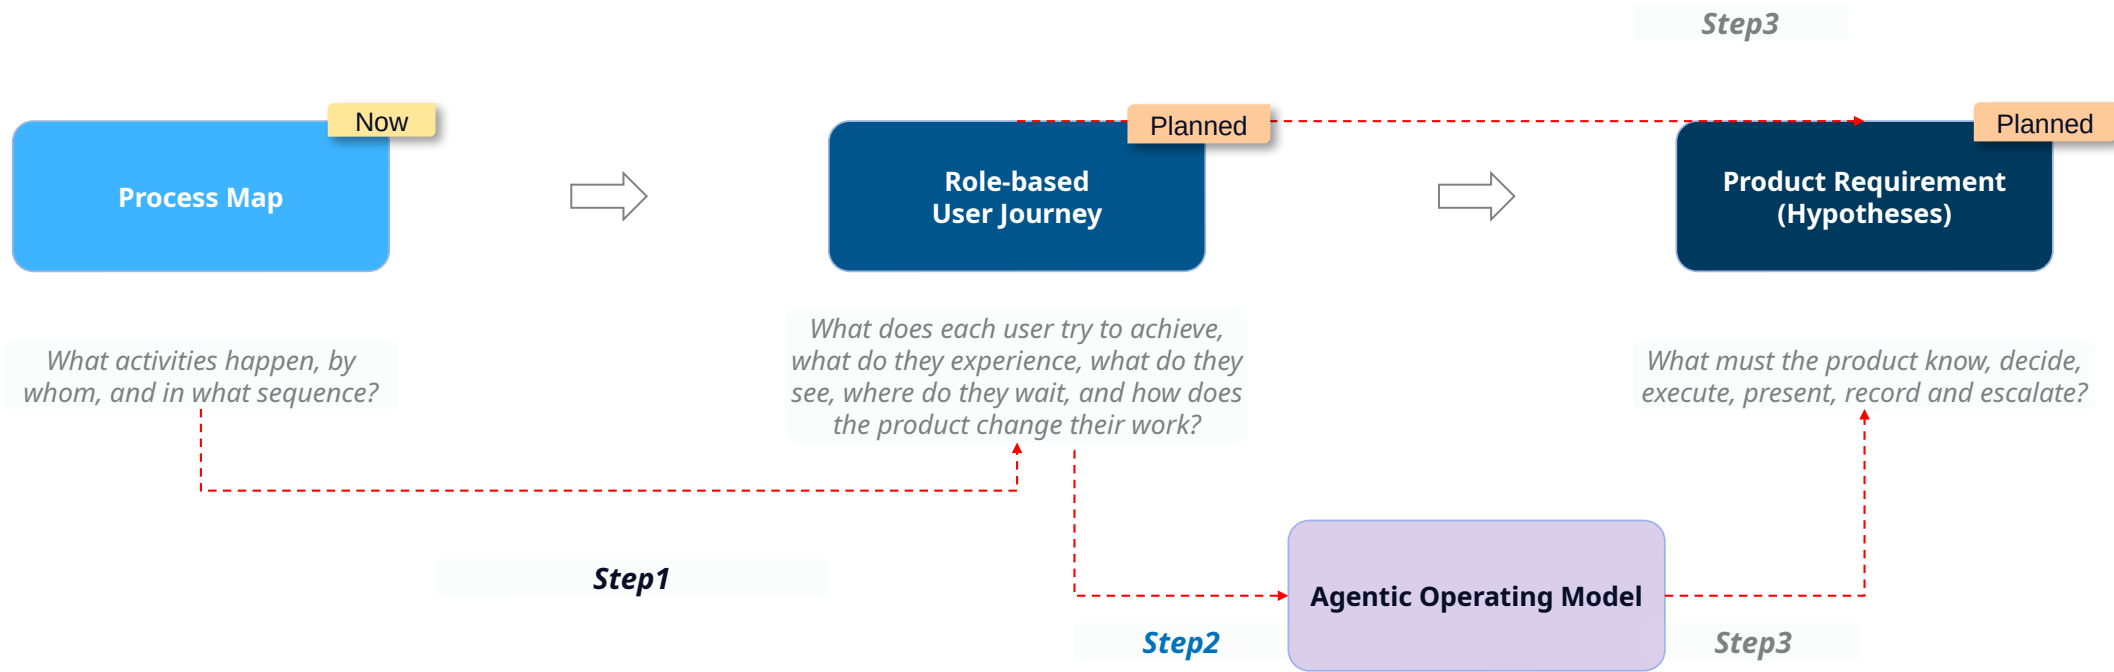

# Target clear-to-trade process

*Dynamic requirements determine what runs; non-dependent fulfilment starts early; readiness is continuously reassessed and published as structured state*

# Build from Process Map → User Journey → Product Requirement

## Recommended Deliverables for Workshop

1. Current User Journey – with pain points and opportunities
2. Target Agentic User Journey – Client/RM/Agentic Product/Human expert/System
3. One Hero Case – consolidate the current pain points and streamline the orchestration
4. Human-in-the-Loop and Autonomy Model – Assist/Prepare/Execute within guardrails/Escalate for judgment
5. Journey-to-Product Requirements – with a scorecard to prioritize the requirements and touch base on the solidification of product requirements

**30 man-days / Ad-hoc catch up / Internal dry run around 9~10 Oct**

## Product Detail Needed

1. Persona and Jobs to Be Done – Objectives/KPI/SLA
2. Multi-language – Multi-region/multi-language
3. Hero Scenario - **New relationship** Product / service extension  
Material change Refresh / reassessment.
4. Human-in-the-Loop Boundary – Escalation flow
5. Existing System Strategy – Keep/Upgrade/Remove
6. Structured State Model – Consolidated AS-IS data schema
7. Success Measures – Target/KPIs

**Step1**  
1.5 weeks  
Consulting + UX/UI  
15 man-days  
(7~16 Sep)

**Step2**  
1 week  
Consulting/5 man-days  
(17~23 Sep)

**Step3**  
1.5~2 weeks  
Consulting/7~10 man-days  
(24 Sep~8 Oct)

## Point solutions digitise steps. They do not simplify the system.

| Client intake                                                                                         | Requirements distillation                                                                                                                                                  | KYC and ID Verification                                                                                 | AML Screening                                                                                                                 | Risk decisioning                                                                                                            | Ongoing monitoring                                                                                     | Offboard                                                                                     | Process orchestration                                                                          | Reporting                                                                                                                           |

| Client information is captured in one tool but is often re-keyed, rechecked or re-requested in others | Customer due diligence requirements are unique by jurisdiction with internal policy overlay. Standard rule libraries are often not fit for institutional client complexity | KYC and ID Verification outputs do not flow cleanly into AML, tax, credit, legal and approval workflows | Screening and sanctions alerts are generated outside the onboarding journey, creating duplicate reviews and manual escalation | Risk tools flag signals while decision tools apply generic logic with the compliance judgment gap remaining a human problem | Periodic review tools are disconnected from trading activity, client priority and relationship context | Exit decisions must be manually pushed across accounts, products, systems and client records | Tools track tasks, but do not orchestrate the full journey across fragmented systems and teams | Dashboards aggregate inconsistent data from disconnected tools requiring manual work to transform data into regulator-ready reports |
| ✗                                                                                                     | ✗                                                                                                                                                                          | ✗                                                                                                       | ✗                                                                                                                             | ✗                                                                                                                           | ✗                                                                                                      | ✗                                                                                            | ✗                                                                                              | ✗                                                                                                                                   |

***Institutional onboarding*** is no longer constrained by a lack of tools. It is ***constrained by too many fragmented tools***, each solving a narrow part of the process while ***pushing complexity back onto the client and frontline teams***

# A typical client fulfilment analyst journey is highly fragmented, slow and has multiple hand-offs
